Received 8 September 2009; accepted 25 September 2009

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(\text{C}—\text{C}) = 0.005$ Å; R factor = 0.066; wR factor = 0.239; data-to-parameter ratio = 14.2.

The asymmetric unit of the title compound, $\text{C}_8\text{H}_9\text{NO}_2$, contains three crystallographically independent molecules, which are essentially planar, the carboxyl O atoms deviating by 0.091 (3), 0.101 (2) and 0.164 (3) Å from the mean plane through the non-H atoms. In the crystal, all three molecules form $\text{O}—\text{H}\cdots\text{O}$ hydrogen-bonded about inversion centers, forming eight-membered rings with graph-set notation $R_2^2(8)$. In addition, $\text{N}—\text{H}\cdots\text{O}$ hydrogen bonding and $\text{C}—\text{H}\cdots\pi$ interactions reinforce the packing.

4-(Methylamino)benzoic acid

İ. Çelik, M. Akkurt, H. Necefoglu, Ö. Aybirdi and S. García-Granda

Comment

Three independent molecules of the title compound (I) in the asymmetric unit are shown in Fig. 1. The bond lengths and angles in the three molecules have normal values. These molecules are not essentially planar (r.m.s. deviations from the mean plane of the non-H atoms are -0.091 (3) Å for atom O1 of the molecule 1, -0.101 (2) Å and 0.164 (3) Å, for atoms O1, O3 and O5 of each molecule, respectively). The dihedral angles between the benzene rings A(C2–C7), B(C10–C17) and C(C18–C23) are A/B = 88.27 (15)°, A/C = 10.63 (16)° and B/C = 89.16 (15)°.

In this structure, the three molecules all form O—H···O hydrogen bonded dimers, between molecules lying about inversion centers, forming eight-membered rings with an $R_2^2(8)$ motif in graph-set notation (Fig. 2). Further, N—H···O hydrogen bonding and C—H··· π interactions reinforces the packing (Table 1, Fig. 3).

Experimental

4-(Methylamino)benzoic acid (0.60468 g, 0.4 mol) (Aldrich) was added to water of 300 ml. The temperature was kept constant at 343 K and solution stirred in a mixer for 1 h, and then solution was left at room temperature to be crystalline. A day later, colourless crystals formed.

Refinement

All H atoms were observed in a differences Fourier map. The H atoms in the title compound were placed geometrically [C—H = 0.93 Å for aromatic, C—H = 0.93 Å for methyl, O—H = 0.82 Å for hydroxyl and N—H = 0.86 Å for NH] and refined with $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5U_{\text{eq}}(\text{C}, \text{N}, \text{O})$, using a riding model. To determine the OH groups correctly, the OH H atoms were geometrically located to both oxygen atoms of the carboxyl group of each molecule, in which their total s.o.f. will be 1. In the final refinement, the values of the s.o.f.'s were determined [0.74 (5) for O1 and 0.26 (5) for O2 in molecule IA, 0.16 (6) for O3 and 0.86 (6) for O4 in molecule IB and 0.75 (5) for O5 and 0.25 (5) for O6 in molecule IC]. Then, *via* the only OH H atoms with the high s.o.f.'s, the refinement process was maintained. Unlike the other two molecules, in the molecule B of the three molecules in the asymmetric unit, the OH H atom is located to the O4(HO4) atom in the opposite direction of the —NHCH₃ group.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.066$	H-atom parameters constrained
$wR(F^2) = 0.239$	$w = 1/[\sigma^2(F_o^2) + (0.1482P)^2]$
$S = 1.08$	where $P = (F_o^2 + 2F_c^2)/3$
4266 reflections	$(\Delta/\sigma)_{\max} < 0.001$
301 parameters	$\Delta\rho_{\max} = 0.29 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -0.28 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

Special details

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted R -factors wR and all goodnesses of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating $-R$ -factor-obs *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
